Luciferase-Based Parasite Growth Inhibition Assay for Measurement of Drug Susceptibility & IC50

Methodology

- Fibroblasts monolayer
- 400 *T. gondii* parasites per well were added.
- (WT + 49c), (WT+ 49b), (Mutant + 49c), (Mutant+ 49b), Control??
- 4 days incubation
- Lyse cells and Parasites in the plate with 150 μL of 2x lysis buffer
- Transfer 20 μL to the reading plates, + 20 μL of substrate buffer
- Chemiluminescence reader

	1	2	3	4	5	6	7	8	9	10	11	12	
A	0		90 nM		180 nM		360 nM		720 nM		1.5 μM		} WT + 49b
B	3 μM		6 μM		12 μM		24 μM		50 μM		10 μM		
C	0		90 nM		180 nM		360 nM		720 nM		1.5 μM		} F386Y+ 49b
D	3 μM		6 μM		12 μM		24 μM		50 μM		10 μM		
E	0		90 nM		180 nM		360 nM		720 nM		1.5 μM		} F386Y+ 49c
F	3 μM		6 μM		12 μM		24 μM		50 μM		10 μM		
G	0		90 nM		180 nM		360 nM		720 nM		1.5 μM		} WT + 49c
H	3 μM		6 μM		12 μM		24 μM		50 μM		10 μM		

Control??

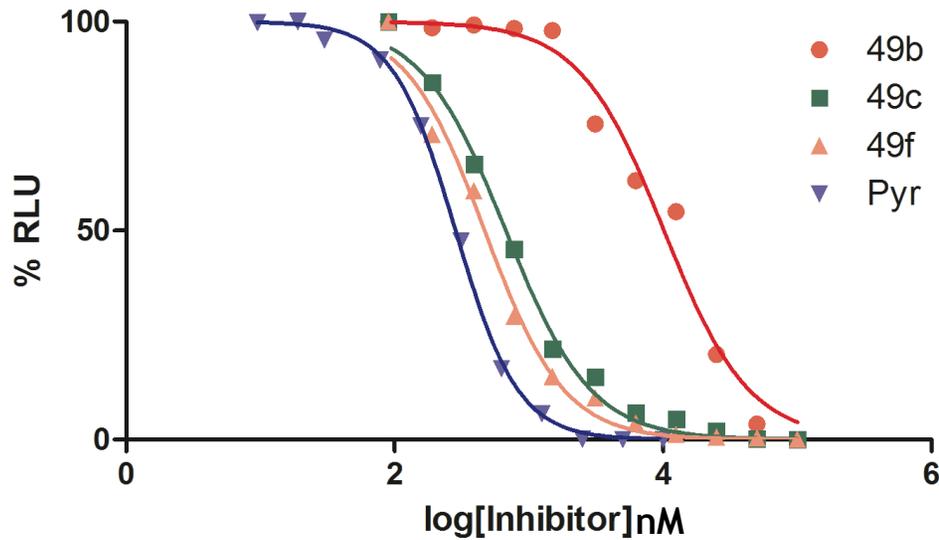

Results

- No well control no drug
- No first 2 wells, mathematically we need 12 points
- Percentage relative to non treated control
- Log, then normalize nonlinear regression fitting
log50

Normalize of Transform of Data 1

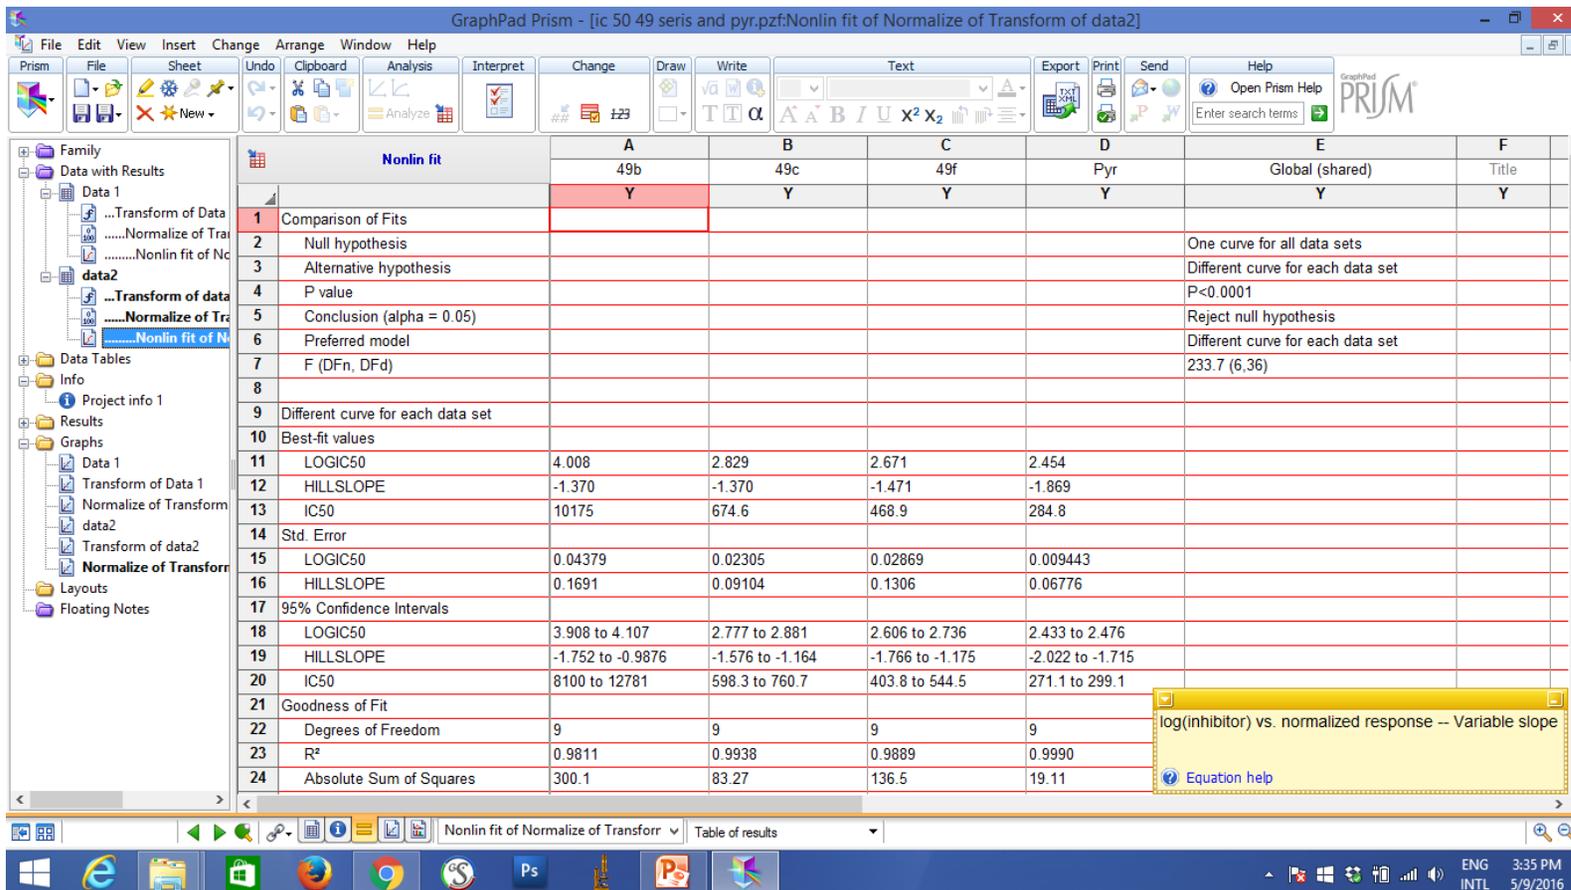

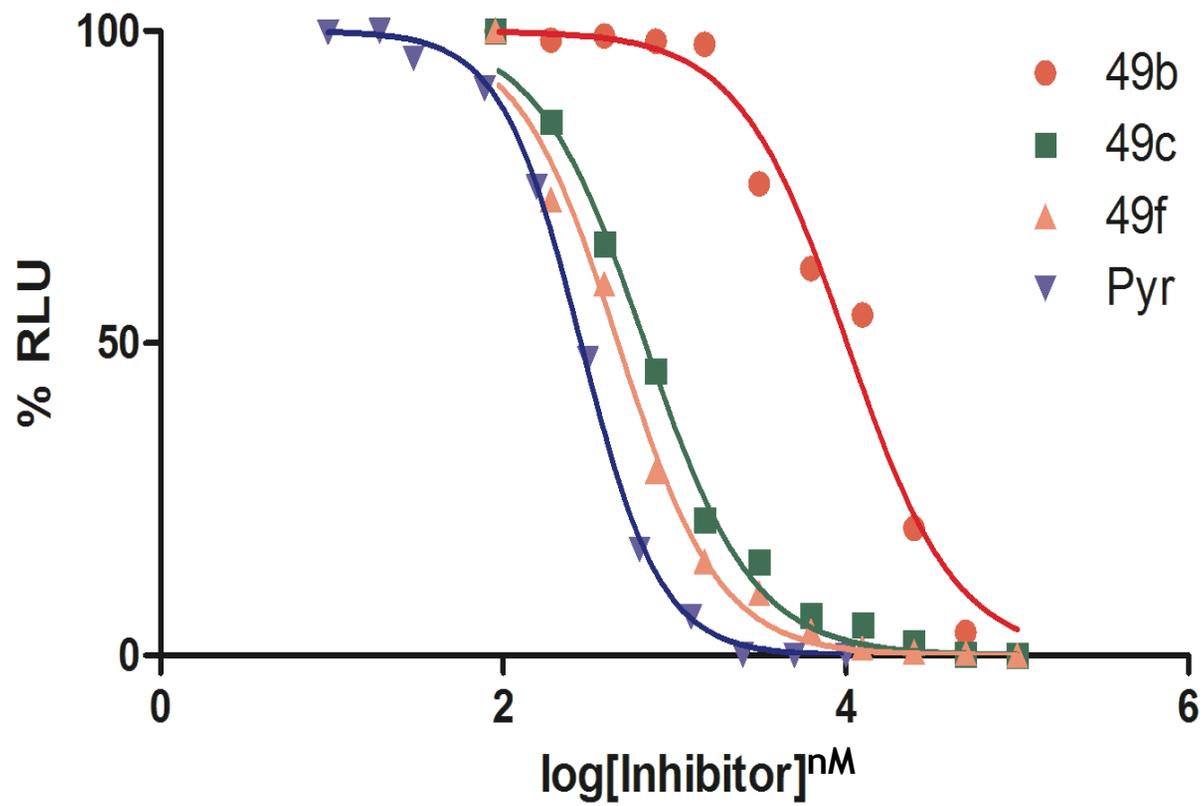

- mutant is more resistant
- data with no sense
- experiment fails
- technical issue (no enough substrate for first 2 wells)

Strain used RH/pTuB
CBG99 luciferase

49c IC50 96h 674.6 nM
49b IC50 96h 10175 nM

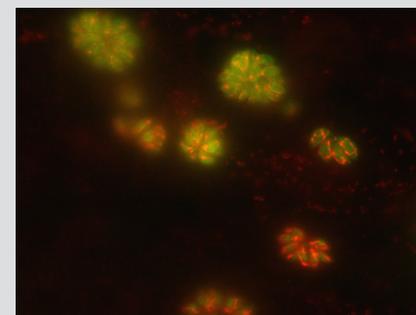

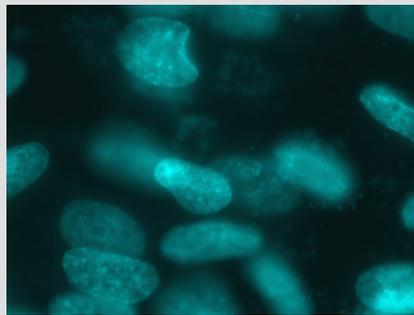

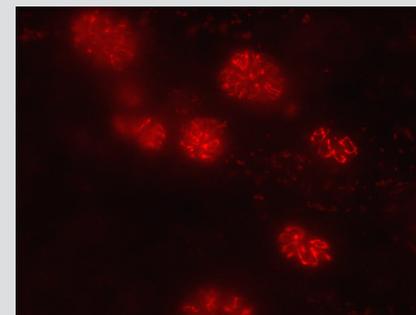

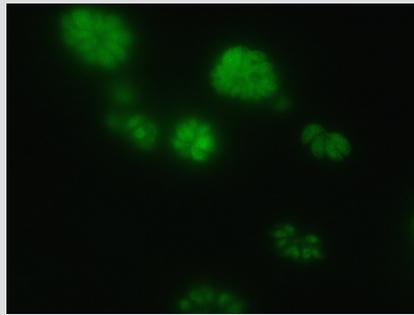

Strain used RH/CBG99 luciferase

49c IC50 96h 674.6 nM

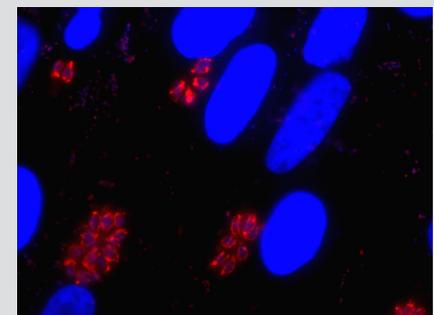

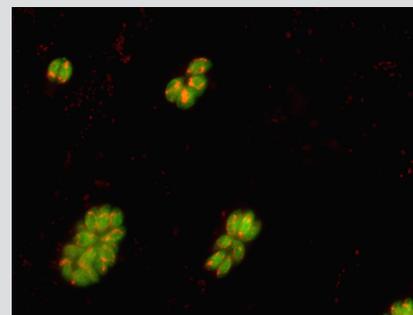

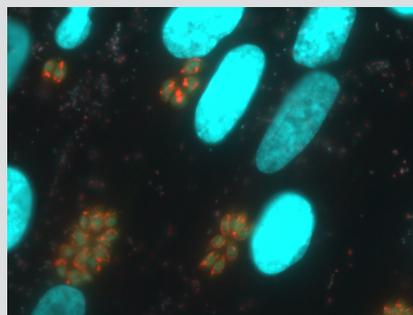

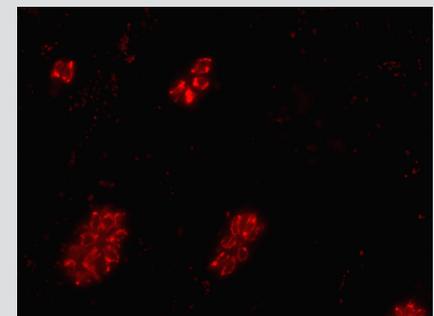

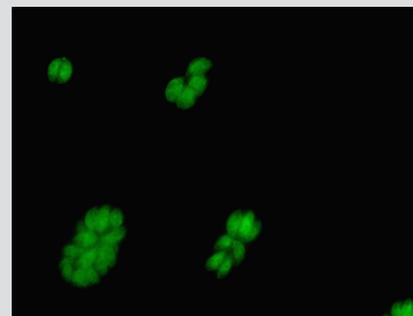

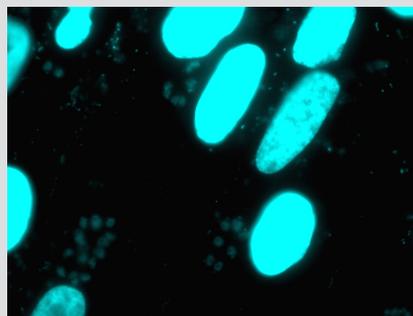

49b IC50 96h 10175 nM
